Exercise - Configure a resource lock

15 minutes

In this exercise, you'll create a resource and configure a resource lock. Storage accounts are one of the easiest types of resource locks to quickly see the impact, so you'll use a storage account for this exercise.

This exercise is a Bring your own subscription exercise, meaning you'll need to provide your own Azure subscription to complete the exercise. Don't worry though, the entire exercise can be completed for free with the 12 month free services when you sign up for an Azure account.

For help with signing up for an Azure account, see the [Create an Azure account](#) learning module.

Once you've created your free account, follow the steps below. If you don't have an Azure account, you can review the steps to see the process for adding a simple resource lock to a resource.

Task 1: Create a resource

In order to apply a resource lock, you have to have a resource created in Azure. The first task focuses on creating a resource that you can then lock in subsequent tasks.

1. Sign in to the Azure portal at <https://portal.azure.com>
2. Select Create a resource.
3. Under Categories, select Storage.
4. Under Storage Account, select Create.
5. On the Basics tab of the Create storage account blade, fill in the following information.
Leave the defaults for everything else.

Setting	Value
Resource group	Create new

Setting	Value
Storage account name	enter a unique storage account name
Location	default
Performance	Standard
Redundancy	Locally redundant storage (LRS)

6. Select Review + Create to review your storage account settings and allow Azure to validate the configuration.
7. Once validated, select Create. Wait for the notification that the account was successfully created.
8. Select Go to resource.

Task 2: Apply a read-only resource lock

In this task you apply a read-only resource lock to the storage account. What impact do you think that will have on the storage account?

1. Scroll down until you find the Settings section of the blade on the left of the screen.
2. Select Locks.
3. Select + Add.

The screenshot shows the Microsoft Azure Storage account settings for 'tempstorage1263'. On the left sidebar, under 'Locks', the 'Locks' option is selected (marked with a red box and the number 2). In the center, a modal dialog titled 'Add lock' is open, also with a red box around it and the number 3. The dialog contains fields for 'Lock name *' (set to 'readonlylock') and 'Lock type *' (set to 'Read-only'). There is a 'Notes' field which is empty. At the bottom right of the dialog are 'OK' and 'Cancel' buttons.

4. Enter a Lock name.

5. Verify the Lock type is set to Read-only.

6. Select OK.

Task 3: Add a container to the storage account

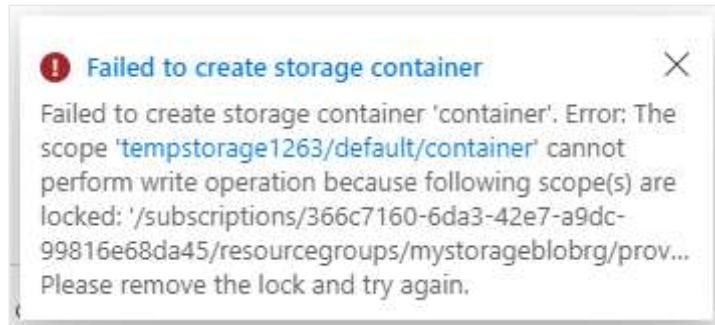

In this task, you add a container to the storage account, this container is where you can store your blobs.

1. Scroll up until you find the Data storage section of the blade on the left of the screen.
2. Select Containers.
3. Select + Container.

The screenshot shows the Microsoft Azure Storage account interface for 'tempstorage1263'. On the left, there's a navigation menu with links like Overview, Activity log, Tags, Diagnose and solve problems, Access Control (IAM), Data migration, Events, and Storage browser (preview). Under 'Data storage', the 'Containers' link is highlighted with a red box and the number '2'. At the top right, there's a search bar, a 'Container' button with a red box and the number '3', and other buttons for Change access level, Restore containers, Refresh, and Delete.

4. Enter a container name and select Create.

5. You should receive an error message: Failed to create storage container.

ⓘ Note

The error message lets you know that you couldn't create a storage container because a lock is in place. The read-only lock prevents any create or update operations on the storage account, so you're unable to create a storage container.

Task 4: Modify the resource lock and create a storage container

1. Scroll down until you find the Settings section of the blade on the left of the screen.
2. Select Locks.
3. Select the read-only resource lock you created.
4. Change the Lock type to Delete and select OK.

The screenshot shows the Microsoft Azure Storage account settings blade for the 'tempstorage1263' account. On the left sidebar, under the 'Data storage' section, the 'Locks' item is highlighted with a red box and the number '2'. In the main content area, a list of locks is shown with one lock selected: 'storagelock'. This selected lock is also highlighted with a red box and the number '3'. A modal dialog titled 'Edit lock' is open over the list, showing the lock name 'storagelock' and the current 'Lock type' set to 'Read-only'. A dropdown menu is open, showing the 'Read-only' option is currently selected, and other options like 'Delete' are available. At the bottom of the modal are 'Delete', 'OK', and 'Cancel' buttons.

5. Scroll up until you find the Data storage section of the blade on the left of the screen.
6. Select Containers.

7. Select + Container.

8. Enter a container name and select Create.

9. Your storage container should appear in your list of containers.

You can now understand how the read-only lock prevented you from adding a container to your storage account. Once the lock type was changed (you could have removed it instead), you were able to add a container.

Task 5: Delete the storage account

You'll actually do this last task twice. Remember that there is a delete lock on the storage account, so you won't actually be able to delete the storage account yet.

1. Scroll up until you find Overview at the top of the blade on the left of the screen.

2. Select Overview.

3. Select Delete.

The screenshot shows the Azure Storage account overview page for 'tempstorage1263'. The left sidebar has a red box around the 'Overview' link, which is labeled with a red number 2. The top toolbar has a red circle with a red number 3 around the 'Delete' button. The main content area displays the storage account's details, including its resource group, location, subscription, and disk state. The 'Properties' tab is selected at the bottom.

You should get a notification letting you know you can't delete the resource because it has a delete lock. In order to delete the storage account, you'll need to remove the delete lock.

The screenshot shows the Microsoft Azure portal interface. At the top, there's a blue header bar with the Microsoft Azure logo and a search bar. Below the header, the breadcrumb navigation shows 'Home > tempstorage1263 > Delete storage account ...'. The main content area is titled 'Delete storage account' and shows the name 'tempstorage1263'. A prominent orange warning box contains the text: '⚠️ 'tempstorage1263' can't be deleted because this resource or its parent has a delete lock. Locks must be removed before this resource can be deleted.' followed by a link 'Learn more about delete locks'. There are three small dots at the bottom right of the warning box.

Task 6: Remove the delete lock and delete the storage account

In the final task, you remove the resource lock and delete the storage account from your Azure account. This step is important. You want to make sure you don't have any idle resource just sitting in your account.

1. Select your storage account name in the breadcrumb at the top of the screen.
2. Scroll down until you find the Settings section of the blade on the left of the screen.
3. Select Locks.
4. Select Delete.
5. Select Home in the breadcrumb at the top of the screen.
6. Select Storage accounts
7. Select the storage account you used for this exercise.
8. Select Delete.
9. To prevent accidental deletion, Azure prompts you to enter the name of the storage account you want to delete. Enter the name of the storage account and select Delete.

Microsoft Azure

Search resources, services

Home > tempstorage1263 >

Delete storage account

tempstorage1263

The following table shows the list of storage services. You can click on them to access data within them.

	Blobs
	Files
	Tables
	Queues

⚠️ This action cannot be undone. This will permanently delete storage account 'tempstorage1263' and its contents. If an immutable policy is applied to the account, or to any residing containers or blobs, the account will not be deleted.

Type the name of the storage account (tempstorage1263) to confirm:

Delete

10. You should receive a message that the storage account was deleted. If you go Home > Storage accounts, you should see that the storage account you created for this exercise is gone.

Congratulations! You've completed configuring, updating, and removing a resource lock on an Azure resource.

 **Important**

Make sure you complete Task 6, the removal of the storage account. You are solely responsible for the resources in your Azure account. Make sure you clean up your account after completing this exercise.
